Joël GILBERT

He became known in the years 2010-2018 by creating the company Sunpartner Technologie and filing around thirty patents in the field of solar energy; and in particular the WYSIPS process which makes a photovoltaic surface transparent. His company has received numerous awards including the Nobel Prize in 2013. A passionate and tireless inventor, he today unveils several innovative technologies in the field of solar energy and water production, and in particular the concept of “photovoltaic greenhouse autonomous in energy and watering water”. This concept was born from a significant improvement in known devices for producing photovoltaic electricity and producing atmospheric water, which he has greatly improved and from which he wishes to be able to benefit as many people as possible.
